

T 2536 EN

Type 2375 Excess Pressure Valve

Self-operated Pressure Regulators for corrosive media

Application

Pressure regulators for set points from **0.8 to 16 bar** · Valve sizes **DN 15 to 50¹⁾** · Pressure rating **PN 40** · Suitable for gases and liquids up to **80 °C**

The valve **opens** when the upstream pressure **rises**.

The Type 2375 Excess Pressure Valve regulates the upstream pressure to the adjusted set point within the range from 0.8 to 16 bar.

Special features

- Low-maintenance proportional regulators requiring no auxiliary energy
- All wetted parts free of non-ferrous metal
- Wide set point range and convenient set point adjustment using a nut
- Soft-seated plug for strict shut-off requirements

Versions

Type 2375 Excess Pressure Valve, consisting of:
Valve size DN 15, 20, 25, 32, 40 and 50 · Actuator with rolling diaphragm²⁾ made of EPDM or FKM · Valve with body made of corrosion-resistant steel 1.4470

ANSI version

Special version

With special materials for applications involving seawater:
1.4538, duplex steel 1.4469 · Nickel-base alloy: 9.4610 · Flanges in higher pressure ratings · Other special materials on request · With metal cover (to protect the set point springs)

Accessories

Screw fitting for control line connection · Control line kit available for tapping the pressure directly at the valve body

²⁾ NBR on request

Principle of operation

The medium flows through the valve (1) as indicated by the arrow. The position of the plug (3) determines the flow rate across the area released between plug and valve seat (2).

The set point springs (7) are loaded by the set point adjuster (6). When relieved of pressure ($p_1 = p_2$), the valve is closed by the force of the set point springs.

The upstream pressure p_1 to be controlled is tapped upstream of the valve and transmitted over the control line (14) to the operating diaphragm (12) where it is converted into a positioning force. This force is used to move the valve plug (3) according to the force of the set point springs (7). The plug stem (5) with the plug is connected to the actuator stem (11) of the actuator (10).

The spring force can be adjusted at the set point adjuster (6). When the force resulting from the upstream pressure p_1 rises above the adjusted set point, the valve opens proportionally to the change in pressure.

Installation of the regulators

Normally, the valve is installed with the actuator on top. Install pipelines horizontally.

For further details on installation refer to Mounting and Operating Instructions ► EB 2536.

The following points must be observed:

- The direction of flow must match the arrow on the valve body.
- Install a strainer (e.g. SAMSON Type 2 NI) upstream of the valve.
