Type 42-37 Flow and Differential Pressure Regulator

Type 42-39 Flow and Differential Pressure or Pressure Regulator

Series 42 Self-operated Regulators

Application

Flow rate and differential pressure control or flow rate and pressure control in district heating systems or large heating networks
Differential pressure or pressure set points **0.1 to 5 bar** · Valves **DN 15 to 250**¹⁾ · Pressure rating **PN 16 to 40** · Suitable for liquids from **5 to 150 °C**¹⁾

The valve **closes** when the differential pressure or flow rate **rises**.

The regulators consist of a valve with adjustable restriction to adjust the flow rate and an actuator with two operating diaphragms.

The regulators limit the flow rate. The set point for the flow rate is adjusted at the valve. The set point for the differential pressure or downstream pressure is adjusted at the diaphragm actuator. The largest signal is always used to control the regulator.

Special features

- Low-noise, medium-controlled proportional regulator requiring little maintenance
- Valve size DN 125 to 250 with fixed plug guide as standard, e.g. installation in riser pipes.
- Suitable for circuit water, water/glycol mixtures and air as well as liquids, provided they do not affect the characteristics of the operating diaphragm.
- Single-seated valve with a plug balanced by a stainless steel bellows or a balancing diaphragm.
- With internal overload protection (excess pressure limiter) in the actuator (Type 42-37)

Versions

Type 42-37 (Fig. 1) · Flow and differential pressure regulator for DN 15 to 250¹⁾ · For installation in the **return flow pipe** of a district heating transfer station

Consisting of a Type 2423 Globe Valve with integrated restriction and a Type 2427 Actuator · Flow rate set point adjustable at the valve · Differential pressure set point adjustable at the actuator

Fig. 1: Type 42-37 Flow and Differential Pressure Regulator

Fig. 2: Type 42-39 Flow and Differential Pressure or Pressure Regulator

Type 42-39 (Fig. 2) · Flow and differential pressure regulator or flow and pressure regulator in DN 15 to 250²⁾ · For installation in the **flow pipe** of a district heating transfer station

Consisting of a Type 2423 Globe Valve with integrated restriction and a Type 2429 Actuator · Flow rate set point adjustable at the valve · Differential pressure or pressure set point adjustable at the actuator

Accessories

Required accessories, such as compression-type fittings, needle valves, equalizing tanks and control lines, are listed in Data Sheet ▶ T 3095.

¹⁾ Other temperature ranges on request

²⁾ Valves for steam and gases on request · ANSI and JIS versions on request · Other temperature ranges on request · Version for mineral oils which do not affect the characteristics of the FKM diaphragm · Valves larger than DN 250 as Type 2334

Principle of operation

The medium flows through the valve in the direction indicated by the arrow. The areas released by the restriction (1.1) and the valve plug (3) determine the flow rate and the differential pressure Δp or the downstream pressure p_2 .

In a fully balanced valve, the position of the plug is not affected by pressure changes in the medium. The upstream pressure p_1 directly downstream of the restriction acts on the outside of the metal bellows or balancing diaphragm, while the downstream pressure p_2 acts on the inside of the bellows or balancing diaphragm (DN 65 to 250). As a result, the forces created by the differential pressure that act on the plug are eliminated.

The differential pressure Δp is converted by the bottom operating diaphragm (12.1) and the differential pressure created at the restriction based on the flow rate by the top operating diaphragm (12.3) into a positioning force. The largest signal is always used to control the regulator.

For example, if the differential pressure Δp rises, the positioning force at the bottom operating diaphragm (12.1) rises as well. This change in force causes the diaphragm stems (12.2 and 12.4) and the valve plug (3) to move in the closing direction. If the flow rate increases, the differential pressure at the restriction (1.1) increases and the pressure drops at the diaphragm chamber A. This change in differential pressure at the restriction only causes the diaphragm stem (12.4) and the valve plug (3) to move in the closing direction until the flow rate reaches the adjusted flow set point.

To control the flow rate, the pressure downstream of the restriction (1.1) is transmitted through a hole in the plug stem (7) and in the diaphragm stem (12.4) to the diaphragm chamber A. The high pressure of the flow is transmitted through the control line (18), attached to the regulator, to the diaphragm chamber B.

To control the differential pressure in the Type 42-37, the high pressure of Δp is transmitted through the control line, which is attached on the site of installation, to the diaphragm chamber D. The low pressure of Δp is equal to the high pressure of the flow rate and is transmitted also to the diaphragm chamber C.

To control the differential pressure in the Type 42-39, the high pressure of Δp is transmitted through the control line (19) to the diaphragm chamber D. The low pressure of Δp is transmitted over a control line (to be attached on assembling the regulator) to the diaphragm chamber C.

When Type 42-39 is used as a flow and pressure regulator, the pressure connection of the diaphragm chamber C remains open.

An overload protection (excess pressure limiter) (15) in the actuator protects the seat (2) and plug (3) from overload during exceptional operating conditions that could lead to valve or plant damage (see Table 1).

1	Type 2423 Valve (balanced by a bellows)	12.2	Diaphragm stem
1.1	Restriction for adjusting the flow rate set point	12.3	Operating diaphragm
2	Seat	12.4	Diaphragm stem
3	Plug	14	Set point spring
5	Metal bellows	15	Force limiter with int. excess pr. limiter (overload protection)
7	Plug stem	17	Set point adjuster for differential pressure
11	Coupling nut	18,	Control lines
12	Type 2427/Type 2429 Actuator	19	Control lines
12.1	Operating diaphragm	A, B,	Diaphragm chambers

Fig. 3: Type 42-37 Flow and Differential Pressure Regulator

Fig. 4: Type 42-39 Flow and Differential Pressure or Pressure Regulator

The principle of operation of the regulator balanced by a bellows or diaphragm only differs concerning the pressure balancing. Valves balanced by a diaphragm (DN 65 to 250) have a balancing diaphragm. The downstream pressure p_2

acts on the bottom of the diaphragm and the upstream pressure p_1 on the top of the diaphragm. As a result, the forces created by the upstream and downstream pressures acting on the valve plug are balanced out.

Table 1: Technical data · Type 42-37 and Type 42-39

Type 2423 Valve · Balanced by a bellows		DN 15 to 250	
Valve size		DN 15 to 250

	0.5 bar	3.5 to 40	6.5 to 55	11 to 90	18 to 180	20 to 260	26 to 450	30 to 520						
Max. perm. diff. pressure Δp	10 bar						12 bar		10 bar					

¹⁾ 7 to 35 m³/h (160 cm² actuator), 7 to 40 m³/h (320 cm² actuator)

Differential pressure across the valve

The minimum required differential pressure Δp_{\min} across the valve is calculated as follows:

$$\Delta p_{\min} = \Delta p_{\text{restriction}} + \left(\frac{\dot{V}}{K_{VS}} \right)^2$$

Δp_{\min}	Minimum differential pressure across the valve in bar
$\Delta p_{\text{restriction}}$	Differential pressure created at the restriction for measuring the flow rate in the regulator
\dot{V}	Adjusted flow rate in m ³ /h
K_{VS}	Valve flow coefficient in m ³ /h

¹⁾ DN 15, 25, 40 and 50 only

²⁾ Optionally with soft seal with standard K_{VS} coefficients

³⁾ Special version 1.4409

⁴⁾ DN 65 to 100: 1.4006

⁵⁾ DN 65 to 80: 1.4104, DN 100: 1.4006, with metal seal

⁶⁾ Special version for mineral oils: FKM

Application

Installation of the regulators

Valve, actuator and control lines are delivered unattached.

Mount the actuator preferably after the valve is installed in the pipeline. It is connected to the bottom section of the valve with a coupling nut (11).

The following points must be observed:

- Install valves in horizontal pipelines.
- The direction of flow must match the arrow on the valve body.
- Install a strainer (e.g. SAMSON Type 2 NI) upstream of the valve.

Permissible mounting positions

- All valve sizes: install the actuator suspended downwards (see photo)
- DN 15 to 80 plus max. 120 °C: install the actuator either suspended or upright
- All valve sizes with fixed plug guide plus max. 120 °C: any position possible
- Steam applications: Always install actuator suspended downwards.

Special version

- With internal parts resistant to mineral oils.
- Valve entirely of stainless steel (at least 1.4301)
- Liquids and vapors up to 220 °C.
- ANSI/JIS version
